## Apollosense

Figure 1 Temperature Dependence in Air

Figure 1 shows the variation of output caused by changes in temperature in $20.9 \%$ oxygen. The mean and $\pm 95 \%$ confidence intervals are shown.

All capillary oxygen sensors show a change in signal with temperature. The repeatable $95 \%$ confidence intervals for the O2-A3 are shown.

Figure 2 Pressure Step Performance

Figure 2 shows how a 25 kPa pressure step change causes a signal transient that decays reproducibly. Negative pressure changes cause a negative transient.
The small shift in final output is less than $10 \%$ of the pressure change, so 10 kPa pressure step shifts output by less than $1 \%$ ( $<0.2 \%$ oxygen).

Figure 3 Long Term Stability

Mass flow Oxygen sensors show excellent long-term stability. Regular calibration is not necessary so long as temperature compensation is correct.
